

Folder Trigger

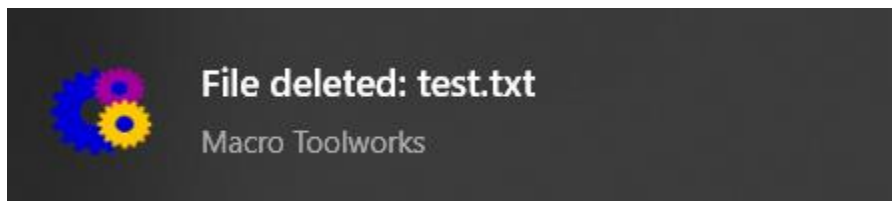

This set of macros watch a user defined folder for a new file creation, deletion, or a file change. A “Setup” macro implements a form that allows user to select a folder to watch, and to select what operation to watch (create, delete change).

The screenshot shows a dialog box titled "Select folder to watch". It features a text input field containing "c:\temp" and a browse button (...). Below the input field, there are three checkboxes under the heading "Select file operations to watch": "File CREATE" (checked), "File CHANGE" (unchecked), and "File DELETE" (checked). The dialog also includes "OK" and "Cancel" buttons.

Depending on what options the user selects the associated macros with predefined folder triggers are enabled.

When the operation (such a file is created) happens, the macro is triggered. The macro contains just a simple command to show notification message.

How to run the macro

Unzip the downloaded file and open *FolderTrigger.4tw* file in the Macro Toolworks Professional (version 9.3.0 or newer). A “Setup” macro will start automatically (since it has option “Run this macro when macro file is loaded” in Options tab enabled) and will show the above mentioned form.
